Need some form of DOCUMENT TEST action where we can deal with and type of attachments that are not going to process correctly.

Collection operations

- Add item to collection
- Check if item exists in collection
- Clear collection
- Count items in collection
- Get item from collection
- Join items in collection
- Merge collections
- Remove duplicates from collection
- Remove item from collection
- Remove value from collection
- Sort items in collection
- Split last item from collection

Perhaps a "Collection" action that would allow looping through an ATTACHMENT collection and testing for Secure and/or password protection in an attachment.
